Education

California Institute of Technology Pasadena, CA

B.S. in Applied and Computational Mathematics | GPA: 4.0/4.0 *Expected Jun. 2029*

- **Relevant Coursework:** Agentic Systems, Diffusion Models, Generative Models, Deep Learning, ML & Data Mining, GPU Programming (CUDA), Operating Systems, Statistical Inference, Probability Models, Applied Linear Algebra
- **Honors:** Y Combinator F25 Acceptance; YC AI Startup School; USACO Platinum; Regeneron STS Scholar; SPIE Scholarship; AIME Qualifier; National Merit Scholar; International Logic Olympiad Silver; Outstanding Presentation Award, Dayton-Cincinnati Aerospace Sciences Conference

Experience

Ascade (Accepted to Y Combinator F25) Jun. 2025 – May 2026

Founder & CTO *San Diego, CA*

- Trained an 8B model with **GRPO** on long-horizon, tool-using tasks in internal verifiable-reward environments (RLVR) with custom tooling; it beats Claude Opus 4.6 and other frontier models on formal-verification benchmarks
- Built an **autoformalization** pipeline that translates English requirements into formal specs, checked by an SMT solver (Z3) in a counterexample-guided refinement loop
- Used them to ship a formally verified payment processor (**$25K MRR**) and to win a **DARPA ERIS** contract and other federal work on verified access control for AI agents

Leonardo DRS Daylight Solutions Jun. 2025 – Aug. 2025

Machine Learning Engineer *San Diego, CA*

- Built custom software for Daylight's laser research team, including user interfaces and real-time sensor analysis
- Built a filtering model with a custom cost function that cut water-vapor noise in laser spectroscopy data by **98%+**
- Replaced the cost function with a piecewise approximation, making the software **50%** faster than the legacy version
- Shipped the model in Daylight's MIRcat laser software, improving signal-to-noise by **99%** in humid conditions

Spectral Energies Feb. 2022 – Jul. 2025

R&D Intern *Remote*

- Designed broadband mid-IR diffraction gratings for ultrafast lasers with **>90%** efficiency over 3.6–6.6 µm; prototypes measured **92%** against 94.2% theoretical
- Co-developed the fabrication process with Penn State Nanofab (electron-beam lithography and anisotropic wet etching) for smooth blazed grooves, a **30%** efficiency gain; tuned Au–Al_2O_3 coatings for damage threshold
- Found a "double-blazing" groove design in simulation (**+50%** bandwidth, **+20%** efficiency); simulation pipelines cut prototype cycles by **70%** and manufacturing error by **80%**
- Delivered 10 gratings to 5+ national labs, supporting **$1.3M+** in R&D contracts

Research Experience

ETH Zurich AI Center, Krause Group (joint with Arnold Lab, Caltech) Oct. 2026 – Present

Researcher, with Prof. Andreas Krause and Prof. Frances Arnold *Remote*

- Building a closed-loop discovery system for enzyme and protein design: an LLM proposes mechanistic hypotheses, each is distilled into a flow model that generates designs, and wet-lab results confirm or refute it
- Developing signed distillation, which folds confirmed hypotheses into the generator and suppresses refuted ones, anchored to the previous model, for campaigns of only $\sim 10^2$ wet-lab measurements
- Evaluating against active search, reward-based fine-tuning and agentic LLM loops, with wet-lab validation in Frances Arnold's lab

Yue Lab, Caltech Jan. 2026 – Present

Undergraduate Researcher, advised by Prof. Yisong Yue *Pasadena, CA*

- Led an 11-author study with Genesis Molecular AI on online adaptation of discrete diffusion models for molecular optimization (RL fine-tuning, Thompson sampling, replay); it matches the best baseline with **58**× fewer oracle calls (**NeurIPS 2026**)
- Showed that extra latent dimensions delay memorization in diffusion models (**3.6**× later on CelebA) and explained it through training dynamics (**ICML 2026 HiLD**; **ICLR 2027** under review)
- Ran distributed training on multi-node GPU clusters (Slurm) with fault-tolerant scheduling

Caltech SURF Fellow, Perona Vision Lab Jun. 2026 – Aug. 2026

Summer Undergraduate Research Fellow, advised by Prof. Pietro Perona *Pasadena, CA*

- Found a family of training objectives for sparse autoencoders (SAEs) that choose which features the SAE learns, so the dictionary can be picked on purpose instead of left to the random seed; linear probes and planted-signal recovery show the dictionaries really differ (**CVPR 2027**, under review)
- Trained a diffusion transformer from scratch and **36** SAEs (**220K+** features) on every layer's residual stream and attention/MLP outputs, then ablated features across denoising steps to trace how they drive generation

UCSD San Diego Supercomputer Center Oct. 2020 – May 2025
Computational Biology Research Intern *San Diego, CA*

- Built ML models that predict protein–ligand binding at **87%** accuracy and screened **50K+** compounds on HPC clusters for HIV and diabetic-cataract drugs
- Raised binding-prediction accuracy by **20%** with docking-simulation data augmentation (3 papers); mentored 3 interns, validating their ML models with docking

Projects

Breaking Pangram's AI-Image Detector | *Independent Red-Teaming* Aug. 2026

- Ran black-box adversarial attacks on a commercial AI-image detector in both directions: adversarially trained autoencoders (VAE, GAN) make arbitrary AI images evade it, and ordinary upscaling produces false positives on real photos; disclosed responsibly and withheld the attack code

Real-Time CUDA Black Hole Renderer | *CS 179 GPU Programming* Jun. 2026

- Co-built a CUDA/C++ ray tracer that bends light through curved spacetime per pixel, rendering gravitational lensing, Einstein rings and a Doppler-shifted accretion disk in real time
- Wrote the CUDA rendering and post-processing kernels (bloom, HDR tone mapping) and a browser viewer with live controls and FPS profiling
- Validated against general relativity: light deflection within **0.44%** of theory, energy drift $<\mathbf{10}^{-6}$, a 12-test physics suite and CPU–GPU parity tests

LLM Inference Engine from Scratch | *PyTorch, Triton* Oct. 2026

- Built a vLLM-style serving engine with a paged KV cache, continuous batching and preemption by recomputation; outputs match Hugging Face token for token against a full-precision reference
- On one A100 it serves **1.26**× the throughput of static batching and cuts median latency under load from 3.6–9.2 s to **0.7 s** (**1.44**× and 1.2 s on an RTX 4060)

Trading on Binary Prediction Markets | *Independent Project* May 2025 – Aug. 2025

- Built an algorithmic trading system with an RL inventory-control policy (**30%** less slippage); arbitrage and hedging returned about **8%** a week over 3 months on a **6**× faster execution API

Skills

Languages: Python, C++, C, CUDA, SQL, Lean 4, Dafny
ML: PyTorch, Transformers, Diffusion Models, Reinforcement Learning, LLM Fine-Tuning, Active Learning, Evals
Interpretability & Safety: Sparse Autoencoders, Causal Interventions, Linear Probing, Red-Teaming
Infrastructure: Distributed Training, Multi-GPU, HPC, Slurm, Linux, Git
AI for Science: Boltz, ESM3, GenMol, DISCO, Protein Engineering, Molecular Optimization
Other: Formal Verification, AI Agents, Nanofabrication, Optical Simulation
